Advantages
- Very compact design
- Energy-saving intermittent cycling
- Many control variants
- Electronic pressure switch
- Digital pressure display
- Quick pressure adjustment by teach-in function
- Electric control optimally adapted
- High-quality leakage-free poppet valves
- Pressure generator also without valves available
- Useful accessory already mounted
- Alternatively manual switch or foot switch
- Ready for connection*

Application
These power units are especially suitable for the operation of small to medium-sized hydraulic clamping fixtures. Maximally two clamping circuits for single or double-acting cylinders are available, that can be controlled independently of each other. Thereby also “shuttle machining” is possible, i.e. that during machining of the workplace in one fixture, workpiece change on the second fixture can be made.

Energy-saving intermittent cycling
The electric motor is only running, as long as hydraulic oil is really required, that means to
- extend and retract the clamping cylinder
- build up the operating pressure

Example
Pressure-time diagram for single-acting clamping cylinders

In this example of a hydraulic clamping fixture the running time of the electric motor corresponds to the clamping time, which is only a few seconds. In standby mode the power consumption is relatively low (see Electrical data). Prerequisites are leakage-free clamping elements, valves and accessories. The pressure control is made by an electronic pressure switch, that switches on the electric motor for a short time in case of a pressure drop.

Control variants
1 clamping circuit
- single acting
- double acting
2 clamping circuits
- single acting
- double acting

Important notes
These power units are exclusively designed for the industrial use of pressure generators for hydraulic clamping fixtures that allow intermittent cycling (see example). All connected hydraulic components must be leakage-free and designed for the maximum operating pressure of the power unit. The power unit supplies very high pressures. The connected clamping cylinders generate very high forces so that there is a permanent danger of crushing in the effective area of the piston rod. The manufacturer of the fixture or the machine is obliged to provide effective protection devices. Installation, start up and maintenance have to be made according to the supplied operating instructions by authorised experts.

Safety features
- Operating pressure infinitely adjustable, therefore precisely defined clamping force
- Electronic pressure switch with digital pressure display
- Repeatability ± 1 bar
- Pressure drop max. 10 %
- Hermetically sealed poppet valves
- Screen disks in the valve ports
- No pressure drop in case of power failure (see page 4)
- Control voltage 24 V DC
- Machine tool interlock (optional)
- Oil level and temperature control (optional)

Delivery
The power units are delivered ready for connection, i.e. after filling of hydraulic oil and connection of the hydraulic and electric lines they are ready for operation.
Switch (Clamping-Unclamping)
The power units are alternatively delivered with connected manual or foot switch (see chart). The pilot light in the switch signals:
1. Switch in clamping position
2. The adjusted clamping pressure is available

Important note!
This message signals that the clamping pressure is available at the electronic pressure switch of the power unit. The actual pressure of the clamping fixture can only be controlled by an installed pressure switch installed on the fixture (see machine tool interlock).

Manual switch

Foot switch

For start up it is imperative to pay attention to the supplied operating instructions!

Note
Power unit with manual switch for coupling systems see ROEMHELD data sheet F 9.425.
**Pressure Clamping**

Part no. 8405 221 B

Example of ordering

Installation. Transferred by two persons to different places of delivery.

With the handle, the power unit can be easily transported. Handle "B" (identification letter "E").

"B" Machine tool interlock

As an option, every clamping circuit is checked by an additional pressure switch which has to be electrically connected directly to the control of the processing machine.

Messages:
1. Clamping pressure available
   → Workpiece can be machined
2. Clamping pressure dropped below 80%
   → Stop machining immediately

Clamping pressure

The switching point must be adjusted to 80% of the adjusted clamping pressure.

Note

If the pressure must be frequently changed, the electronic pressure switch is easier to adjust (identification letter "E").

**Handle "B"**

With the handle, the power unit can be easily transported by two persons to different places of installation.

Example of ordering

Power unit 8405 221 with handle Part no. 8405221 B

Electronic pressure switch for machine tool interlock "E"

(Instead of the mechanical pressure switch)

The lower switching point (80% of the clamping pressure) of electronic pressure switches is firmly set and can be stored in teach mode for every desired clamping pressure by pressing a button.

**Oil level and temperature control "T"**

The oil level and temperature control is installed in the reservoir cover and electrically connected to the control box. In case of an error message, the control LED below the main switch is lit.

Possible errors:
1. Oil filling quantity < 2.3 l
   Shortage 0.7 l below the minimum oil level gauge.
2. Oil temperature > 63 °C
   Required refilling quantity min. 1.5 l

Recommendation

As long as the error message is available the electric motor does no longer start to avoid damages due to overheating. This means that in the case of a pressure drop the pump does not deliver!

Above all with automated operation the oil level and temperature control should only be used for machine tool interlock in combination with pressure switches. This is the only way to ensure that during the switch-off of the electric motor the workpiece machining will be interrupted in the case of a pressure drop of more than 20%.

Example of ordering

Power unit 8405 238 with machine tool interlock and oil level and temperature control Part no. 8405238 T

**Different combinations**

The three options described above are also available in combination. When placing the order please stick to the following sequence:

- "T" + "B" + "E" 8 4 0 5  X X X X X B E
- "T" + "E" 8 4 0 5  X X X T E
- "B" + "E" 8 4 0 5  X X X B E
- "T" + "B" + "E" 8 4 0 5  X X X T B E

Tested

Hydraulic control

The hydraulic control is designed for direct manifold mounting without pipes and consists of the following components:

- The connecting block with pressure relief valve to adjust the desired operating pressure. The maximum operating pressure (chart page 3) is mechanically limited in the factory.
- Series mounting plate with electronic pressure switch and digital pressure display to adjust the switch-off pressure for the electric motor. The adjustment is made in teach-in mode independent of the adjustment of the pressure relief valve.
- A pressure drop of approx. 10 % will cause the pump motor to start again.

Alternative:

.Series mounting plate with electronic pressure switch and pressure switch for machine tool interlock (see page 3)

Valves

Only leakage-free poppet valves are used to allow the energy-saving intermittent cycling (see page 1). The electric control is designed for maximally two solenoid valves.

- Single-acting cylinders

One 3/2 directional control valve per clamping circuit is directly operated by a manual switch or a foot switch.

Double-acting cylinder

The 4/2 directional control valve is a combination of an electrically and a hydraulically operated 3/2 directional control valve. The control is made by a manual switch or a foot switch.

Operation of two clamping fixtures

The control enables the operation of two clamping fixtures by means of two manual switches or two foot switches. Prerequisite is the same operating pressure of both fixtures.

Safety in case of power failure

The solenoid valves are de-energized in “clamping position”. In the case of power failure this switching position is remained and thereby also the hydraulic pressure in the clamping line. A pressure drop is only to be feared with leaking clamping elements or valves.

Technical data

Relative duty cycle

These power units are only suitable for intermittent cycling (intermittent cycling S3 as per VDE 0530).

\[
\text{Relative duty cycle} = \frac{t_B}{t_S} \times 100\%
\]

The maximum duty cycle is a function of the motor load. Apart from the load, the motor winding temperature of the submerged motor is in principle dependent on oil temperature and oil level. With maximum oil level, the complete winding is submerged in oil and optimally cooled. With decreasing oil surface a part of the winding is in the air. Since air is a poor heat conductor, the winding temperature increases considerably. Therefore the load of the motor must be reduced. The following chart indicates the relative cycle time as a function of the oil level in the reservoir. The maximum oil temperature of 60 °C must not be exceeded (see “Oil level and temperature control”).

Maximum relative cycle time [%ED]

(at room temperature 23 °C)
